# A Circle with Code

[Live Example](#)

```
vec3 rgb(float r, float g, float b) {  
    return vec3(r / 255.0, g / 255.0, b / 255.0);  
}  
  
vec4 circle(vec2 uv, vec2 pos, float rad, vec3 color) {  
    float d = length(pos - uv) - rad;  
    float t = clamp(d, 0.0, 1.0);  
    return vec4(color, 1.0 - t);  
}  
  
void mainImage( out vec4 fragColor, in vec2 fragCoord ) {  
  
    vec2 uv = fragCoord.xy;  
    vec2 center = iResolution.xy * 0.5;  
    float radius = 0.25 * iResolution.y;  
  
    // Background layer  
    vec4 layer1 = vec4(rgb(210.0, 222.0, 228.0), 1.0);  
  
    // Circle  
    vec3 red = rgb(225.0, 95.0, 60.0);  
    vec4 layer2 = circle(uv, center, radius, red);  
  
    // Blend the two  
    fragColor = mix(layer1, layer2, layer2.a);  
}
```

# Marching Cubes on GPU

## Challenge

- Generating a connected mesh with threads that cant communicate with each other

# Attempt in browser using WebGPU

# Shader describes the volume of a given space

```
float calculateDensity(float x, float y, float z, float time) {  
    float3 center = float3(0.5, 0.5, 0.5);  
    float radius = 0.25;  
  
    float3 radialVector = center - float3(x,y,z);  
    float distance = length(radialVector);  
    float density = -distance + 1.1;  
    return density;  
}
```

# Split the space in subsections

Each cube will be calculated by a thread on the gpu in parallel

For each cube (subsection)

calculate the density of its corners

# For each cube (subsection)

if density is higher than 1 the point is inside the mesh

# For each cube (subsection)

Generate a vert on edges that transition between inside and outside mesh.

-> Give each vert a unique Id for later duplicate removal.

```
struct Vert {  
    float3 pos;  
    int index;  
};
```

# For each cube (subsection)

Generate faces with the triangulation lookup table

```
struct Vert {  
    float3 pos;  
    int index;  
};  
  
struct CubeData {  
    int infos;  
    Vert verts[12];  
    int3 faces[5];  
};
```

On CPU remove duplicate verts
